. The results show that the R403Q mutation leads to an apparent gain of protein function but a greater energetic cost of tension generation. Increased energy cost of tension generation may be central to the FHC disease process, help explain some unresolved clinical observations, and carry significant therapeutic implications.

The Cardiac Sarcomere and its Components

Distinct hypertrophic cardiomyopathy genotypes result in convergent sarcomeric proteoform profiles revealed by top-down proteomics

PNAS | October 6, 2020 | vol. 117 | no. 40 | 24691–24700

This study suggests that the manifestations of severe HCM coalesces at the proteoform level despite distinct genotype, which underscores the importance of molecular characterization of HCM phenotype and presents an opportunity to identify broad-spectrum treatments to mitigate the most severe manifestations of this genetically heterogenous disease

Altered phosphorylation of cTnT, Tpm1.1, and MLC-2v. Representative deconvoluted mass spectra from donor hearts (black) and HCM tissues (red) for (A) cTnT, (B) Tpm1.1, and (C) MLC-2v.

EXPLORER-HCM: Mavacamten in Symptomatic Patients With oHCM

- **Mavacamten**

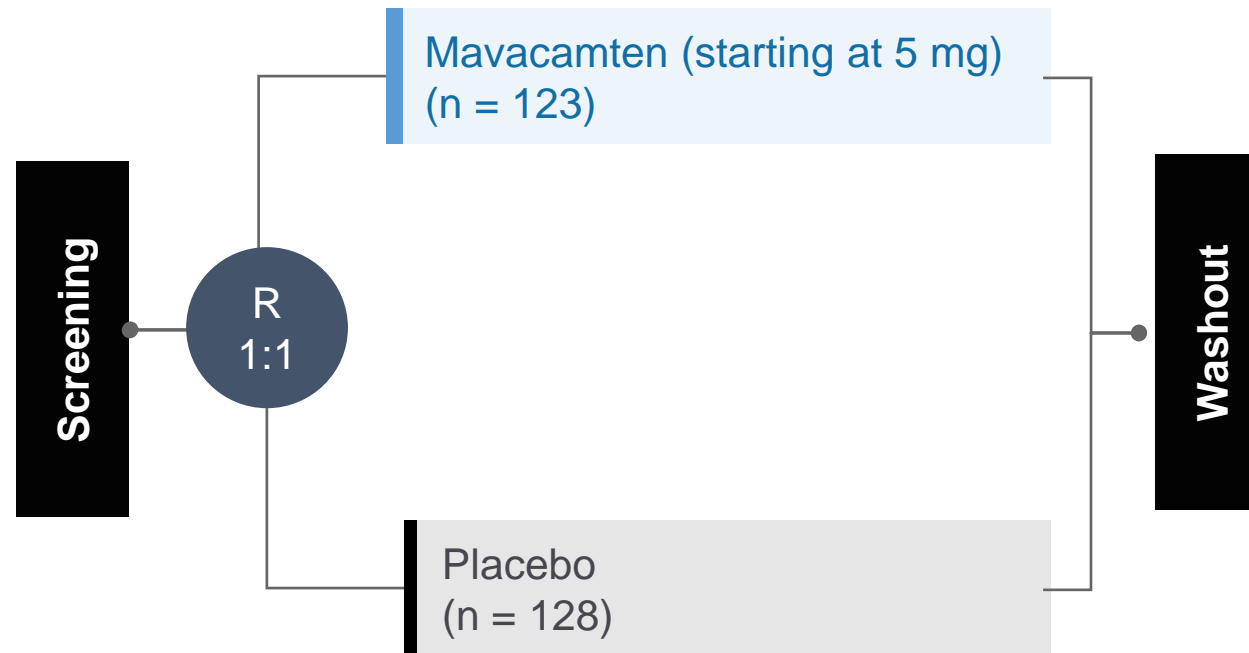

- Myosin ATPase inhibitor

- Phase 3
- Randomized
- Double blind
- Placebo controlled

- 251 patients
- 68 clinical centers
- 13 countries

- Patients with:

- HCM with an LVOT gradient ≥ 50 mm Hg
- NYHA Class II to III

30 wk

Visits for assessment of patient status occurred every 2 to 4 wk

Primary endpoint

≥ 1.5 mL/kg/min increase in pVO₂ and ≥ 1 NYHA class reduction

or

≥ 3.0 mL/kg/min pVO₂ increase without NYHA class worsening

- ATPase, adenosine triphosphatase; NYHA, New York Heart Association; pVO₂, peak oxygen consumption.
- Olivotto I, et al. Lancet. 2020;396:759-769.

EXPLORER-HCM: Primary and Secondary Endpoints

	Mavacamten (n = 123)	Placebo (n = 128)	Difference (95% CI) P Value

HCM Detection Algorithms from Mayo & UCSF Showed a Marked Reduction in HCM Risk Score Following Mavacamten Treatment in the PIONEER-OLE Cohort

JOURNAL OF THE AMERICAN COLLEGE OF CARDIOLOGY

VOL. 79, NO. 10, 2022
ISSN 0735-1097/\$36.00

Letters

Assessment of Disease Status and Treatment Response With Artificial Intelligence–Enhanced Electrocardiography in Obstructive Hypertrophic Cardiomyopathy

to approximate HCM prevalence. Both algorithms were then applied to all ECGs (n = 216) from each patient in PIONEER-OLE who had pretreatment and on-treatment through January 29, 2020. We examined longitudinal associations of AI-ECG–predicted HCM scores with echocardiographic and laboratory metrics important to HCM clinical decision-making.

Mean age of the PIONEER-OLE cohort at baseline was 57.8 years; 69.2% of patients were men, and 92.3% had New York Heart Association functional class II symptoms. Median follow-up was 79 weeks (range: 25.0–90.1 weeks). To discriminate PIONEER-OLE pretreatment HCM ECGs from ECGs of age and/or sex-matched non-HCM control subjects, area under the receiver-operating characteristic curves were 0.938 (95% CI: 0.924–0.950) for the UCSF algorithm and 0.979 (95% CI: 0.942–1.000) for the Mayo algorithm. Sensitivity and specificity were 84.6% and

Although hypertrophic cardiomyopathy (HCM) causes significant morbidity and is a leading cause of sudden death in adolescents, initial detection remains difficult. Although echocardiography is an important

CK-274 (Aficamten): Next-In-Class Cardiac Myosin Inhibitor

- Potential *in vivo* pharmacodynamic advantages related to distinctive binding site
- Optimized for
 - Onset of action (reach steady state within two weeks)
 - Rapid reversibility of effect
 - Minimal drug-drug interactions
 - Favorable tolerability
 - Ease of titration for personalized dosing
- Clear pharmacokinetic/pharmacodynamic (PK/PD) relationship observed
- Shallow exposure-response relationship

Conclusions

A molecular approach targeting the specific pathophysiological mechanisms of the disease has emerged, and will hopefully change the HCM panorama in the next few years.

Optimal treatment will require evidence-based positioning of each available options, in a tailored perspective which, after 60 years, finally looks at hand.

Major challenges remain and further data are needed, to validate this molecular approaches the whole HCM spectrum.

HCM is a heterogeneous, complex disease with low hard event rates: establishing convincing end-points for clinical trials is challenging. Dedicated efforts in the field are urgently needed.
