REPORT ON EXPERT COMMITTEE MEETINGS

Report by the Director-General

1. Introduction

In compliance with paragraph 10.6 of the regulations for expert advisory panels and committees,[1] the Director-General is here reporting on the action to be taken with reference to meetings of Expert Committees.

2. Reports

The reports of expert committee meetings which have been prepared in both working languages, since the twenty-seventh session of the Executive Board and are now available for annexation to this report are the following:

Expert Committee on Antibiotics (Standardization of Methods for Conducting Microbic Sensitivity Tests)

Expert Committee on Chronic Cor Pulmonale

Expert Committee on Professional and Technical Education of Medical and Auxiliary Personnel (Recommended Requirements for Schools of Public Health)

Expert Committee on Public Health Administration (Planning of Public Health Services)

Expert Committee on Specifications for Pharmaceutical Preparations - Sub-Committee on Non-Proprietary Names

Expert Committee on Specifications for Pharmaceutical Preparations

In 1961, a report of the WHO Expert Committee on Chronic Cor Pulmonale mentioned clearly that the mean pulmonary arterial pressure (mPAP) **does not normally exceed 15 mmHg** when the subject is at rest in a lying position, and that the value was **little affected by age** and **never exceeded 20 mmHg**.

CLINICAL PROGRESS

Chronic Cor Pulmonale

Report of an Expert Committee*

Contents

Foreword

IN THE early months of 1960, the Director-General of the World Health Organization appointed an Expert Committee to inquire into and write a report on the subject of cor pulmonale.

In order to facilitate the preliminary study, as well as the actual deliberations of the Committee, two consultants were appointed, to prepare a survey of the subject: Professor H. Denolin, Chargé de cours á l'Université de Bruxelles; and Dr. C. M. Fletcher, Senior Lecturer in Medicine, Postgraduate Medical School, London. This, a sixty-page report, was put together by Drs. Denolin and Fletcher during July, 1960, and made available to Committee members shortly thereafter.

The membership of the Expert Committee was as follows: Dr. J. Dankmeijer, Professor of Anatomy, Embryology and Physical Anthropology, University of Leiden, the Netherlands; Dr. F. Herles, Professor of Medicine II Internal Clinic, Charles University, Prague, Czechoslovakia; Dr. M. Ibrahim, formerly Professor of Cardiology, Faculty of Medicine, Cairo University, Cairo, Province of Egypt, United Arab Republic; Dr. D. D. Reid, Professor of Epidemiology, Department of Medical Statistics and Epidemiology, London School of Hygiene and Tropical Medicine, London, England; Dr. D. W. Richards, Lambert Professor of Medicine, College of Physicians and Surgeons, Columbia University, New

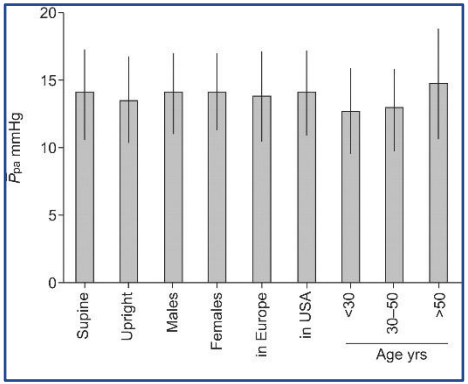
Definition	Haemodynamic characteristics
PH	**mPAP >20 mmHg**
Pre-capillary PH	mPAP >20 mmHg PAWP ≤15 mmHg **PVR >2 WU**
Isolated post-capillary PH	mPAP >20 mmHg PAWP >15 mmHg **PVR ≤2 WU**
Combined post- and pre-capillary PH	mPAP >20 mmHg PAWP >15 mmHg **PVR >2 WU**
Exercise PH	**mPAP/CO slope between rest and exercise >3 mmHg/L/min**

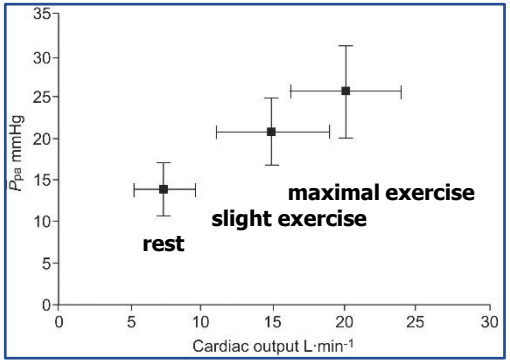
Pulmonary arterial pressure during rest and exercise in healthy subjects: a systematic review

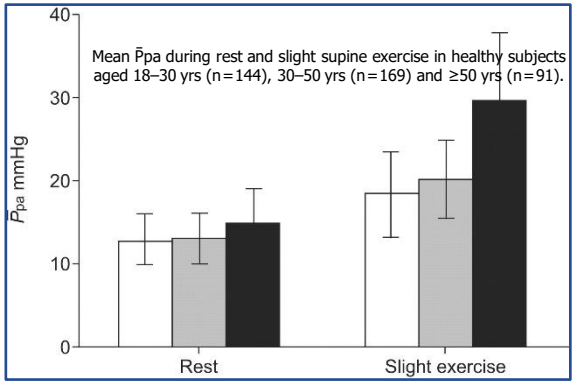
G. Kovacs*, A. Berghold#, S. Scheidl* and H. Olschewski*

Co je horní hranice normálního tlaku v plicnici?

RHC studies in healthy individuals to determine **normal values of mPAP** at rest and exercise. Data from 1187 normal subjects from 47 studies were analysed. mPAP at rest was 14.0±3.3 mmHg; this value was independent of sex and ethnicity, and was only slightly influenced by age and posture.



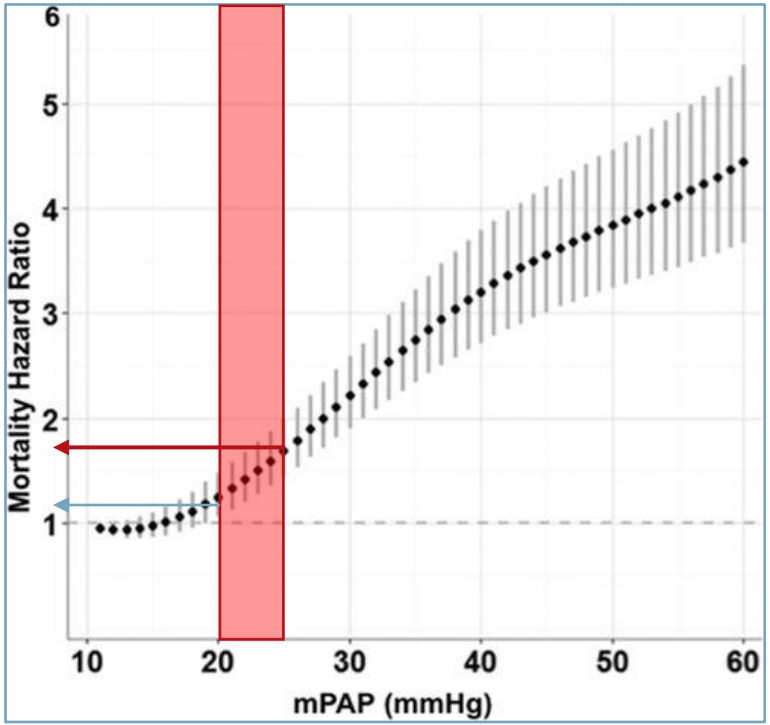


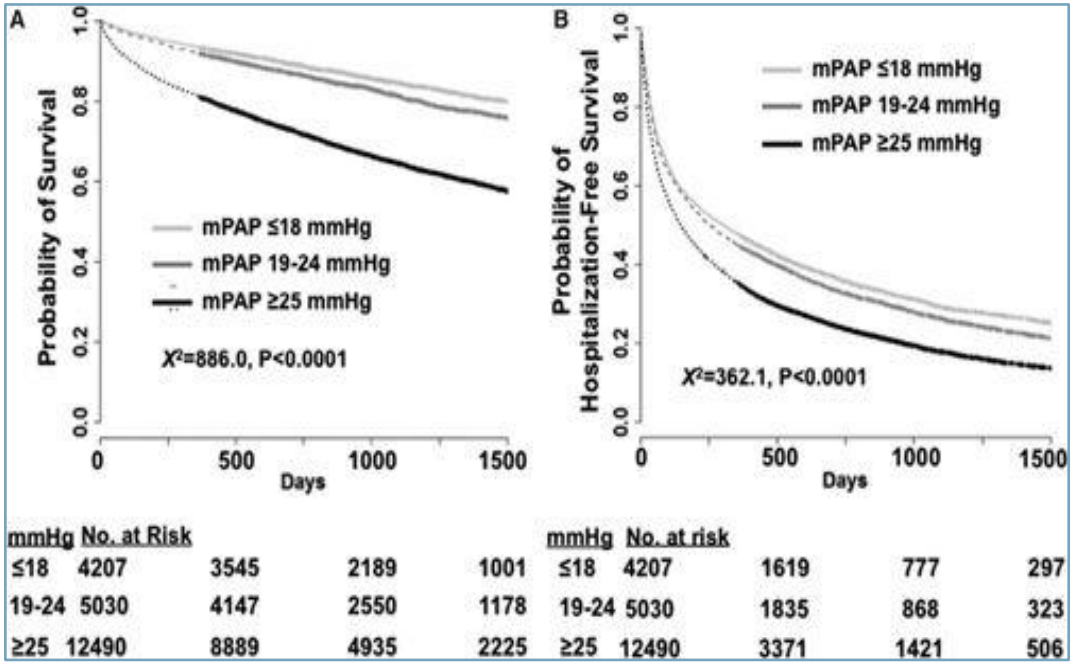


Considering this mPAP of 14 mmHg, two standard deviations would suggest mPAP >20 mmHg as above the upper limit of normal (i.e. above the 97.5th percentile).
This definition is, therefore, no longer arbitrary, but based on a scientific approach.

G. Kovacs et al. Eur Respir J 2009;34:888-894

Má hraniční mPAP vliv na prognózu?





mmHg	No. at Risk			
≤18	4207	3545	2189	1001
19-24	5030	4147	2550	1178
≥25	12490	8889	4935	2225

mmHg	No. at risk

Determinants and Prognostic Significance of Exercise Pulmonary Hypertension in Asymptomatic Severe Aortic Stenosis
Patrizio Lancellotti, Julien Magne, Erwan Donal, Kim O'Connor, Raluca Dulgheru, Monica Rosca and Luc A. Pierard
Circulation. 2012;126:851-859; originally published online July 25, 2012;
doi: 10.1161/CIRCULATIONAHA.111.088427

Print ISSN: 0009-7322. Online ISSN: 1524-4539

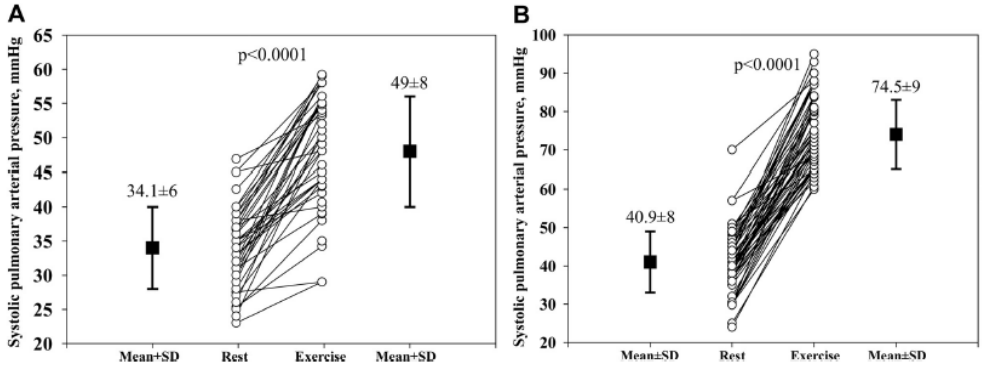

Figure 1. Impact of exercise on systolic pulmonary arterial pressure in patients without exercise pulmonary hypertension (**A**) and with exercise pulmonary hypertension (**B**).

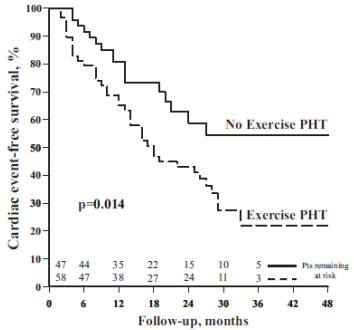

Figure 2. Cardiac event-free survival according to the presence or absence of exercise pulmonary hypertension (PHT).

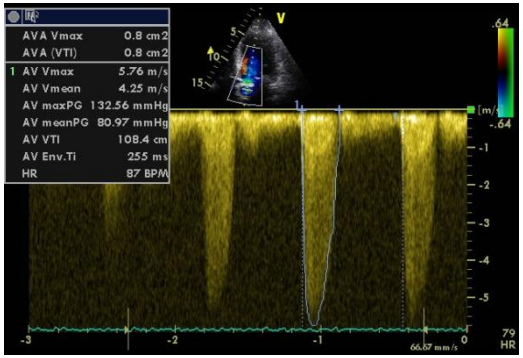
C) Asymptomatic patients with severe aortic stenosis (refers only to patients eligible for surgical valve replacement)		
SAVR is indicated in asymptomatic patients with severe aortic stenosis and systolic LV dysfunction (LVEF <50%) not due to another cause.	I	C
SAVR is indicated in asymptomatic patients with severe aortic stenosis and an abnormal exercise test showing symptoms on exercise clearly related to aortic stenosis.	I	C
SAVR should be considered in asymptomatic patients with severe aortic stenosis and an abnormal exercise test showing a decrease in blood pressure below baseline.	IIa	C
SAVR should be considered in asymptomatic patients with normal ejection fraction and none of the above-mentioned exercise test abnormalities if the surgical risk is low and one of the following findings is present: • Very severe aortic stenosis defined by a V_{max} >5.5 m/s • Severe valve calcification and a rate of V_{max} progression ≥0.3 m/s/year • Markedly elevated BNP levels (>threefold age- and sex-corrected normal range) confirmed by repeated measurements without other explanations • Severe pulmonary hypertension (systolic pulmonary artery pressure at rest >60 mmHg confirmed by invasive measurement) without other explanation.	IIa	C



Indications for surgery in asymptomatic aortic stenosis

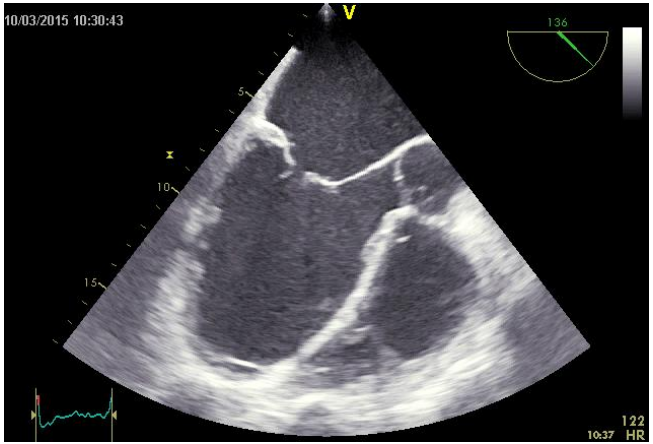
New IIa C recommendation:

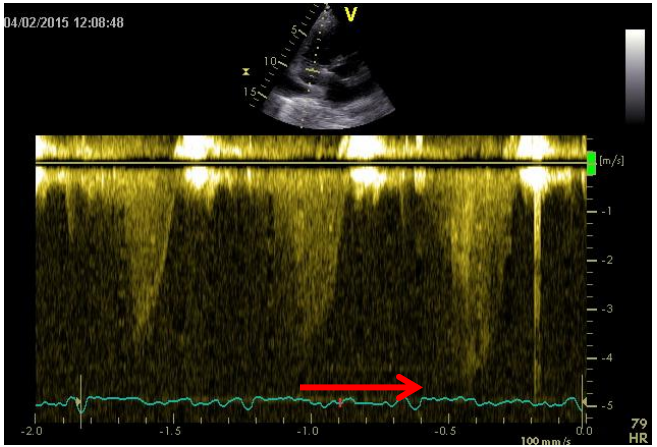
Severe pulmonary hypertension (systolic pulmonary artery pressure at rest >60 mmHg confirmed by invasive measurement) without other explanation.

Indications for intervention in asymptomatic severe primary mitral regurgitation

New additional statement:

If pulmonary hypertension (SPAP >50 mmHg at rest) is the only indication for surgery, the value should be confirmed by invasive measurement.





HTx

Patients to consider	End-stage HF with severe symptoms, a poor prognosis, and no remaining alternative treatment options. Motivated, well informed, and emotionally stable. Capable of complying with the intensive treatment required postoperatively.
Contra-indications	Active infection. Severe peripheral arterial or cerebrovascular disease. Pharmacologically irreversible pulmonary hypertension (LVAD should be considered with a subsequent re-evaluation to establish candidacy). Cancer (a collaboration with oncology specialists should occur to stratify each patient as to their risk of tumour recurrence). Irreversible renal dysfunction (e.g. creatinine clearance <30 mL/min). Systemic disease with multi-organ involvement. Other serious co-morbidity with poor prognosis. Pre-transplant BMI >35 kg/m² (weight loss is recommended to achieve a BMI <35 kg/m²). Current alcohol or drug abuse. Any patient for whom social supports are deemed insufficient to achieve compliant care in the outpatient setting.

LVAD

Patients with >2 months of severe symptoms despite optimal medical and device therapy and more than one of the following:
LVEF <25% and, if measured, peak VO_2 <12 mL/kg/min.
≥3 HF hospitalizations in previous 12 months without an obvious precipitating cause.
Dependence on i.v. inotropic therapy.
Progressive end-organ dysfunction (worsening renal and/or hepatic function) due to reduced perfusion and not to inadequate ventricular filling pressure (PCWP ≥20 mmHg and SBP ≤80–90 mmHg or CI ≤2 L/min/m²).
Absence of severe right ventricular dysfunction together with severe tricuspid regurgitation.

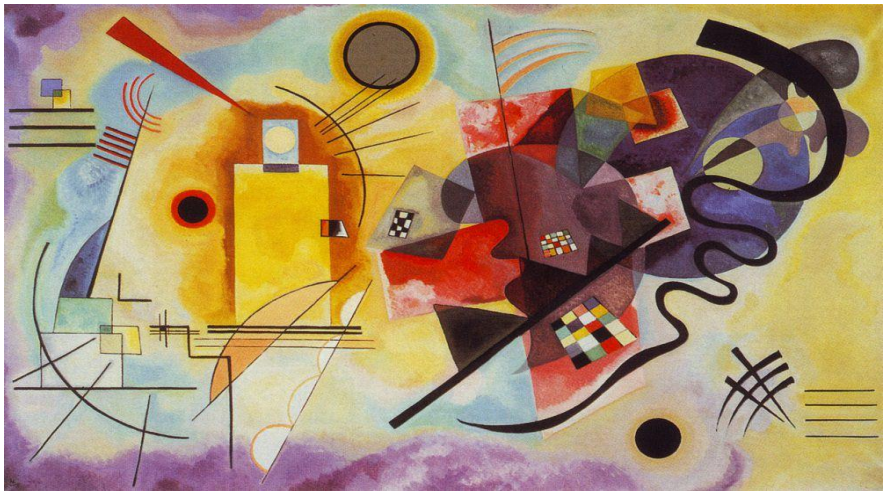
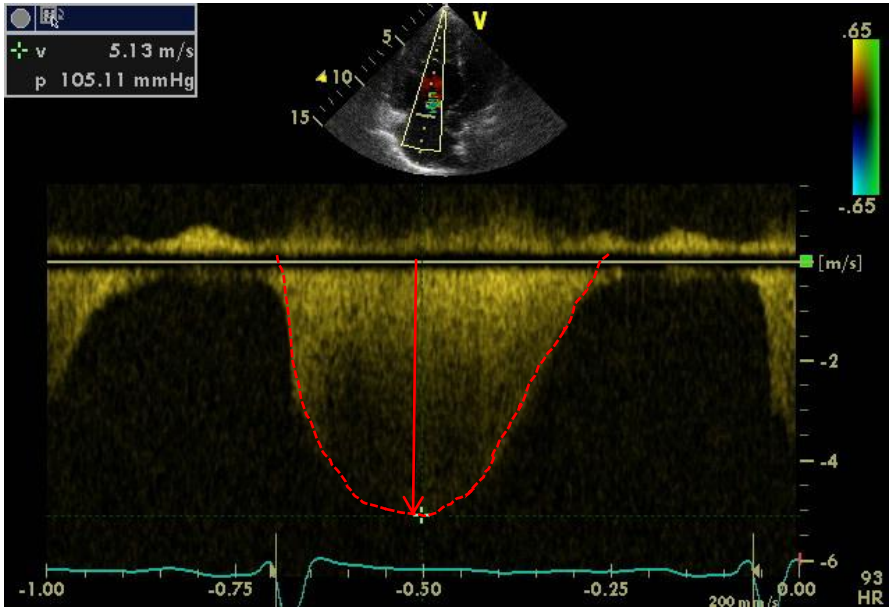
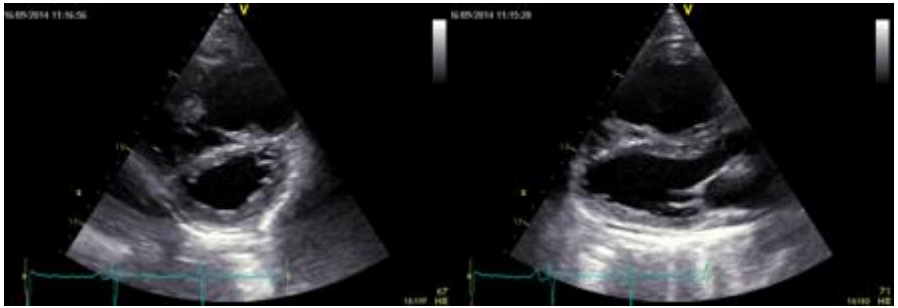
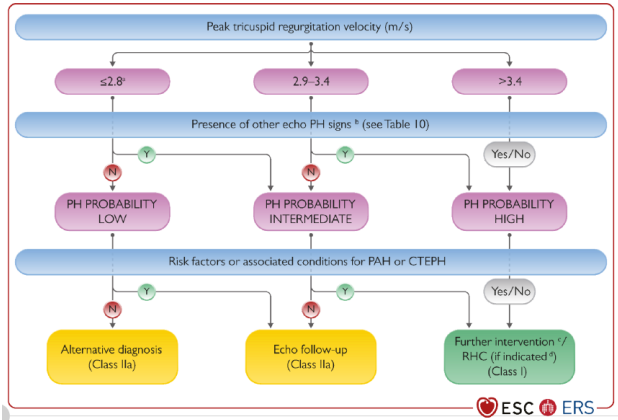
PRAVÁ KOMORA A ZOBRAZOVACÍ METODY





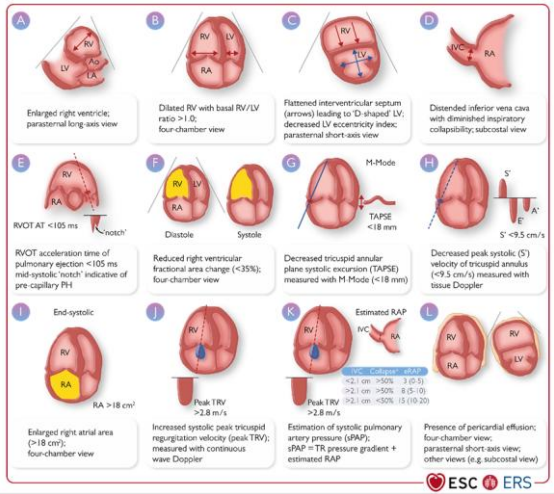




Same threshold for TRV
(≤ 2.8 m/s, 2.9 – 3.4, > 3.4 m/s)

Presence of other PH signs
(TAPSE/PAPs for coupling)

Presence of risk factors
(echo follow-up)



Echokardiografie je nejpoužívanějším screenigovým nástrojem

1. **Dvourozměrná echokardiografie** hodnotí funkci pravé komory (RV). Dysfunkce RV má širokou škálu etiologií, z nichž PH je nejběžnější.
2. **Dopplerovská echokardiografie** je užitečná, protože odhaduje rychlost trikuspidálního regurgitativního paprsku (TR jet), což je odhad systolického tlaku v pravé komoře (eRSVP) / systolického tlaku v plicní tepně (ePASP).
3. **Zátěžová echokardiografie** detekuje plicní hypertenzi vyvolanou zátěží, její použití pro screening PAH u pacientů se SSc zůstává do značné míry výzkumnou.

Několik studií pacientů s SSc se známými rizikovými faktory pro PAH i bez nich uvádí míru zvýšeného odhadovaného PASP v rozmezí od 11-14%. Existují však falešně pozitivní i negativní výsledky, které naznačují, že pro screening není echokardiografie vhodná samotná.

Odhad systolického tlaku v plicnici - trikuspidální regurgitační gradient

základní parametr pro screening PH pomocí echokardiografie

pro **hodnocení prognózy a rozhodnutí o terapii nemá význam**

vzestup odhadovaného sPAP nemusí nutně ukazovat progresi onemocnění, pokles odhadovaného sPAP nemusí nutně odpovídat zlepšení PAP

invazivně měřený mPAP má rovněž poměrně malý prognostický význam (kromě responderů akutní vazoreaktivity)

Tabulka 4A – Pravděpodobnost zjištění plicní hypertenze echokardiografickým vyšetřením symptomatických pacientů s podezřením na plicní hypertenzi

Maximální rychlost proudu krve při nedomykavosti trojcípé chlopně (m/s)	Přítomnost jiných „známek PH" při echokardiografickém vyšetření[a]	Možnost plicní hypertenze podle echokardiografického vyšetření
≤ 2,8 nebo neměřitelná	Ne	Nízká
≤ 2,8 nebo neměřitelná	Ano	Středně vysoká
2,9–3,4	Ne	
2,9–3,4	Ano	Vysoká
> 3,4	Není nutno provádět

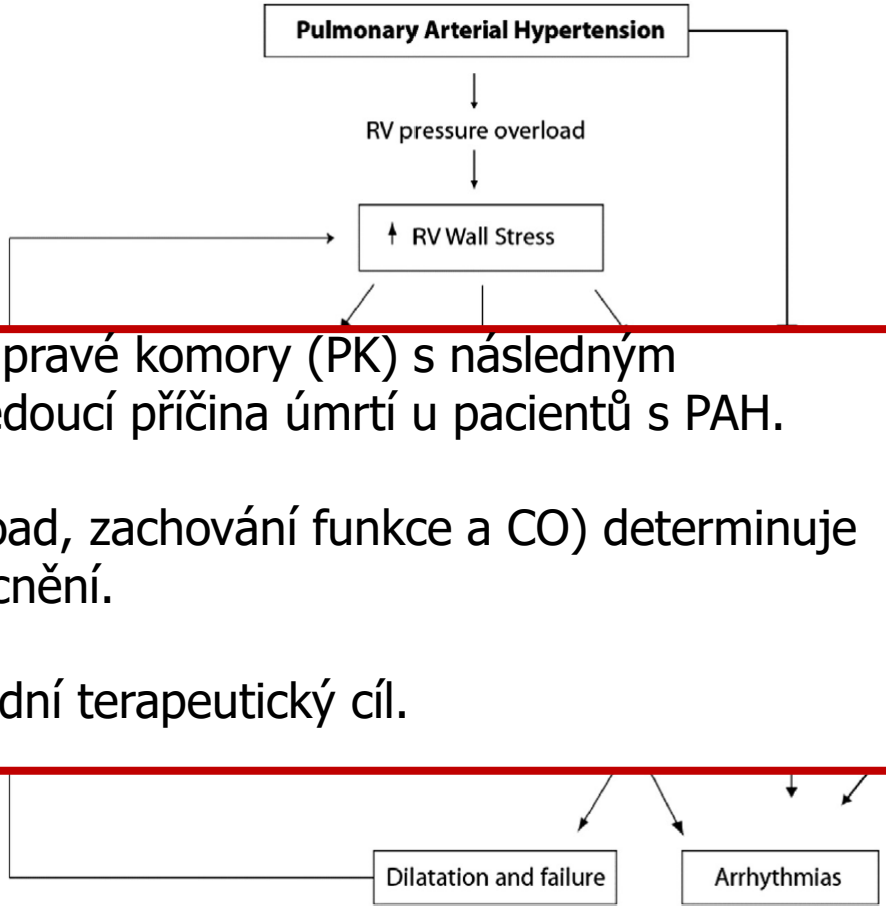
Pravá komora u PAH

- An **afterload mismatch** - increased RV afterload, driven by increased PVR, leads to right heart failure.
- At an early stage, the RV adapts to the increased afterload to preserve stroke volume (**homeometric adaptation**), followed by an **heterometric**

- Vyčerpání kompenzačních mechanismů pravé komory (PK) s následným pravostranným srdečním selháním je vedoucí příčina úmrtí u pacientů s PAH.
- Funkce PK (adaptace na zvýšený afterload, zachování funkce a CO) determinuje funkční status a klinický průběh onemocnění.
- Zachování/zlepšení funkce PK jako zásadní terapeutický cíl.

- In contrast, *maladapted ventricles* usually are characterized by **uncoupling of the RV to the pulmonary circulation**



Vonk-Noordegraaf A et al. JA Am Coll Cardiol 2013; Vol. 62, No. 25, Suppl D; D22–33;

Miotti C et al. J Clin Med 2021, 10, 619.

Reverzní remodelace PK

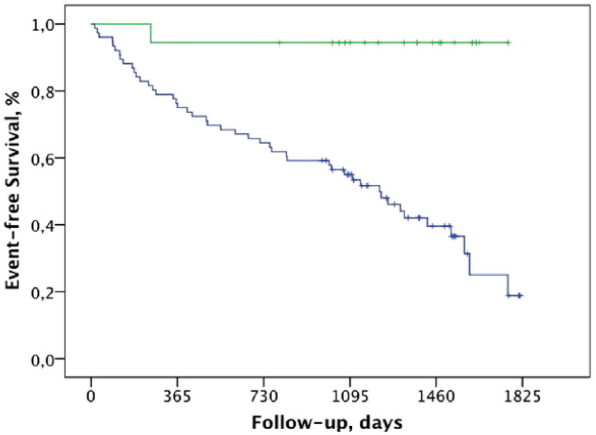


Figure 6 Event-free survival of patients with right heart reverse remodeling (green line; echo score, 4–4.5) compared with patients without right heart reverse remodeling (blue line; echo score, < 4): 94%, 94%, and 94% vs 75%, 55%, and 24% after 1, 3, and 5 years of follow-up, respectively, from the 1-year re-evaluation (p = 0.0001).

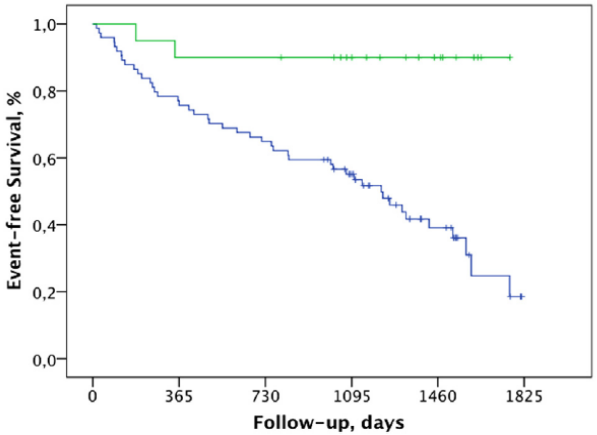

Figure 7 Event-free survival of patients with right heart reverse remodeling (green line) compared with patients without right heart reverse remodeling RHRR (blue line), defined by the presence of the upper tertile of all 3 echo parameters: 88%, 83%, and 83% vs 76, 55%, and 23% after 1, 3, and 5 years of follow-up, respectively, from the 1-year reevaluation (p = 0.001).

decrease in RV enddiastolic area (RVEDA) [-2,45 cm^2 (sensitivity 93 %; specificity 40 %)], **right atrial (RA) area** [-1.30 cm^2 (sensitivity 75 %; specificity 63 %)], **and left ventricular systolic eccentricity index (LV-EIs)** [-0.12 (sensitivity 88 %; specificity 44 %)]
