# Trend of Percentages of Deaths – Czechia and US

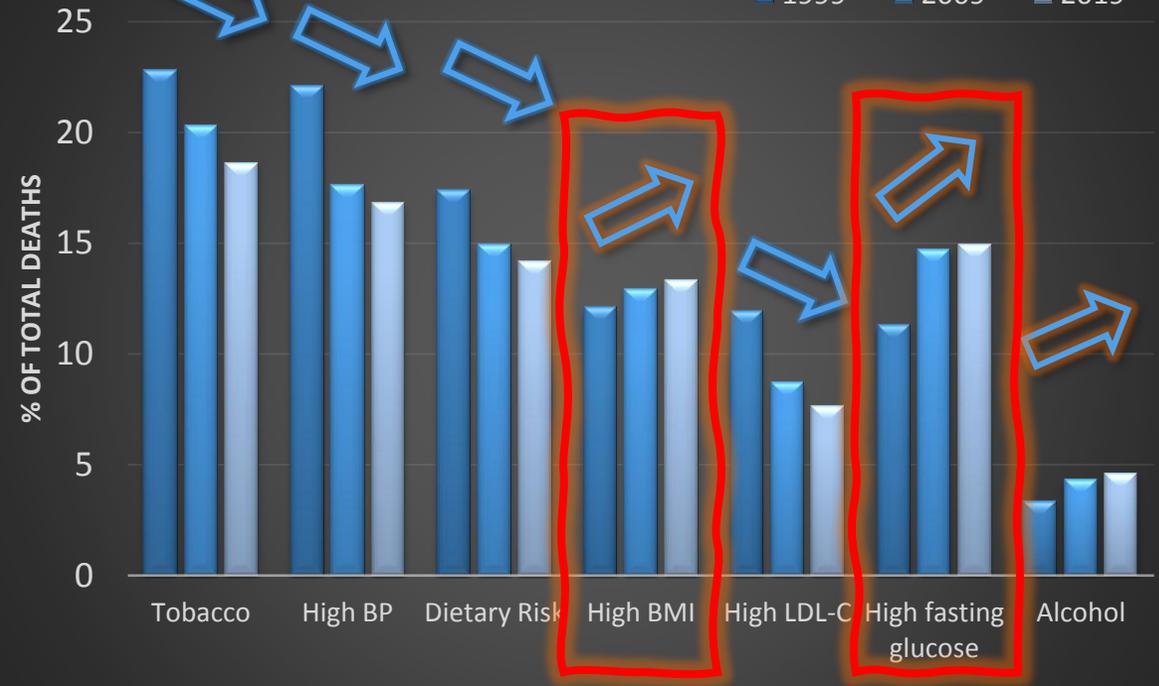

## Czechia

1999 2009 2019

## United States

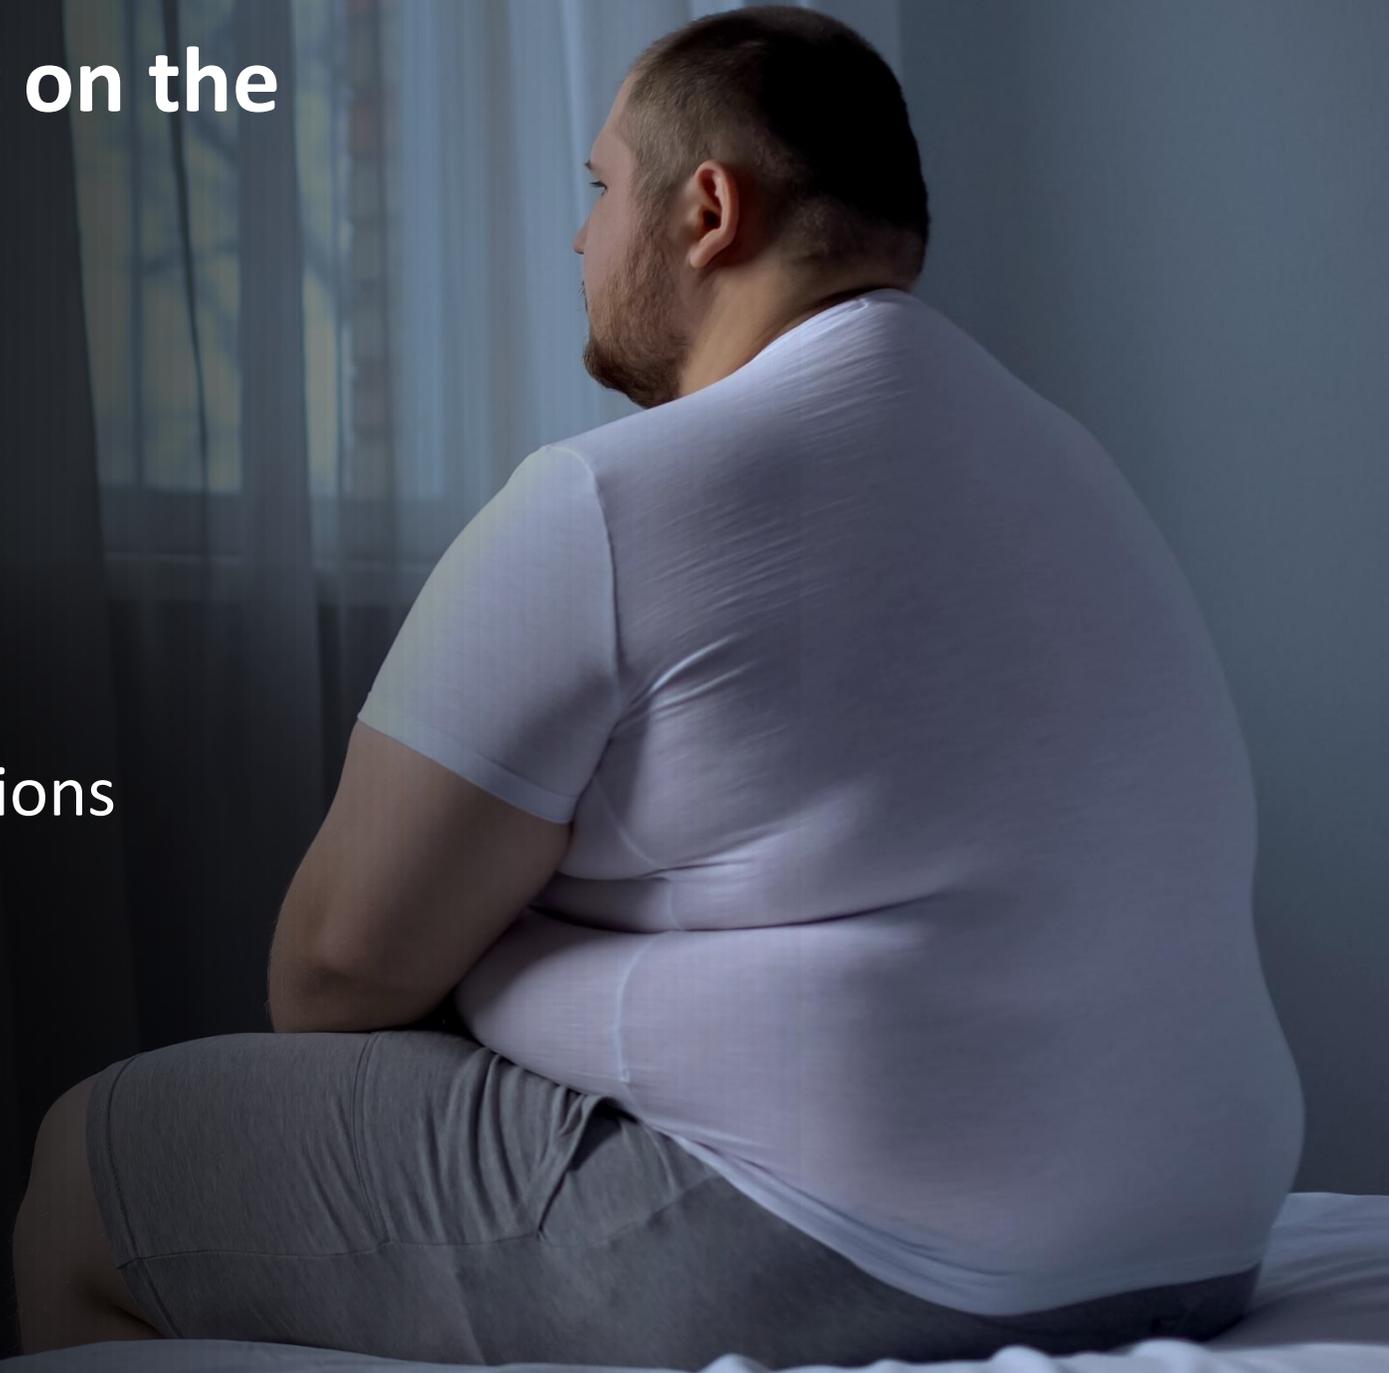

1999 2009 2019

# Need for the Improvement on the Approach

**Obesity** is BMI-centric

- Clinical Inertia
- Stigma
- Controversy related to limitations
- Not considered a disease

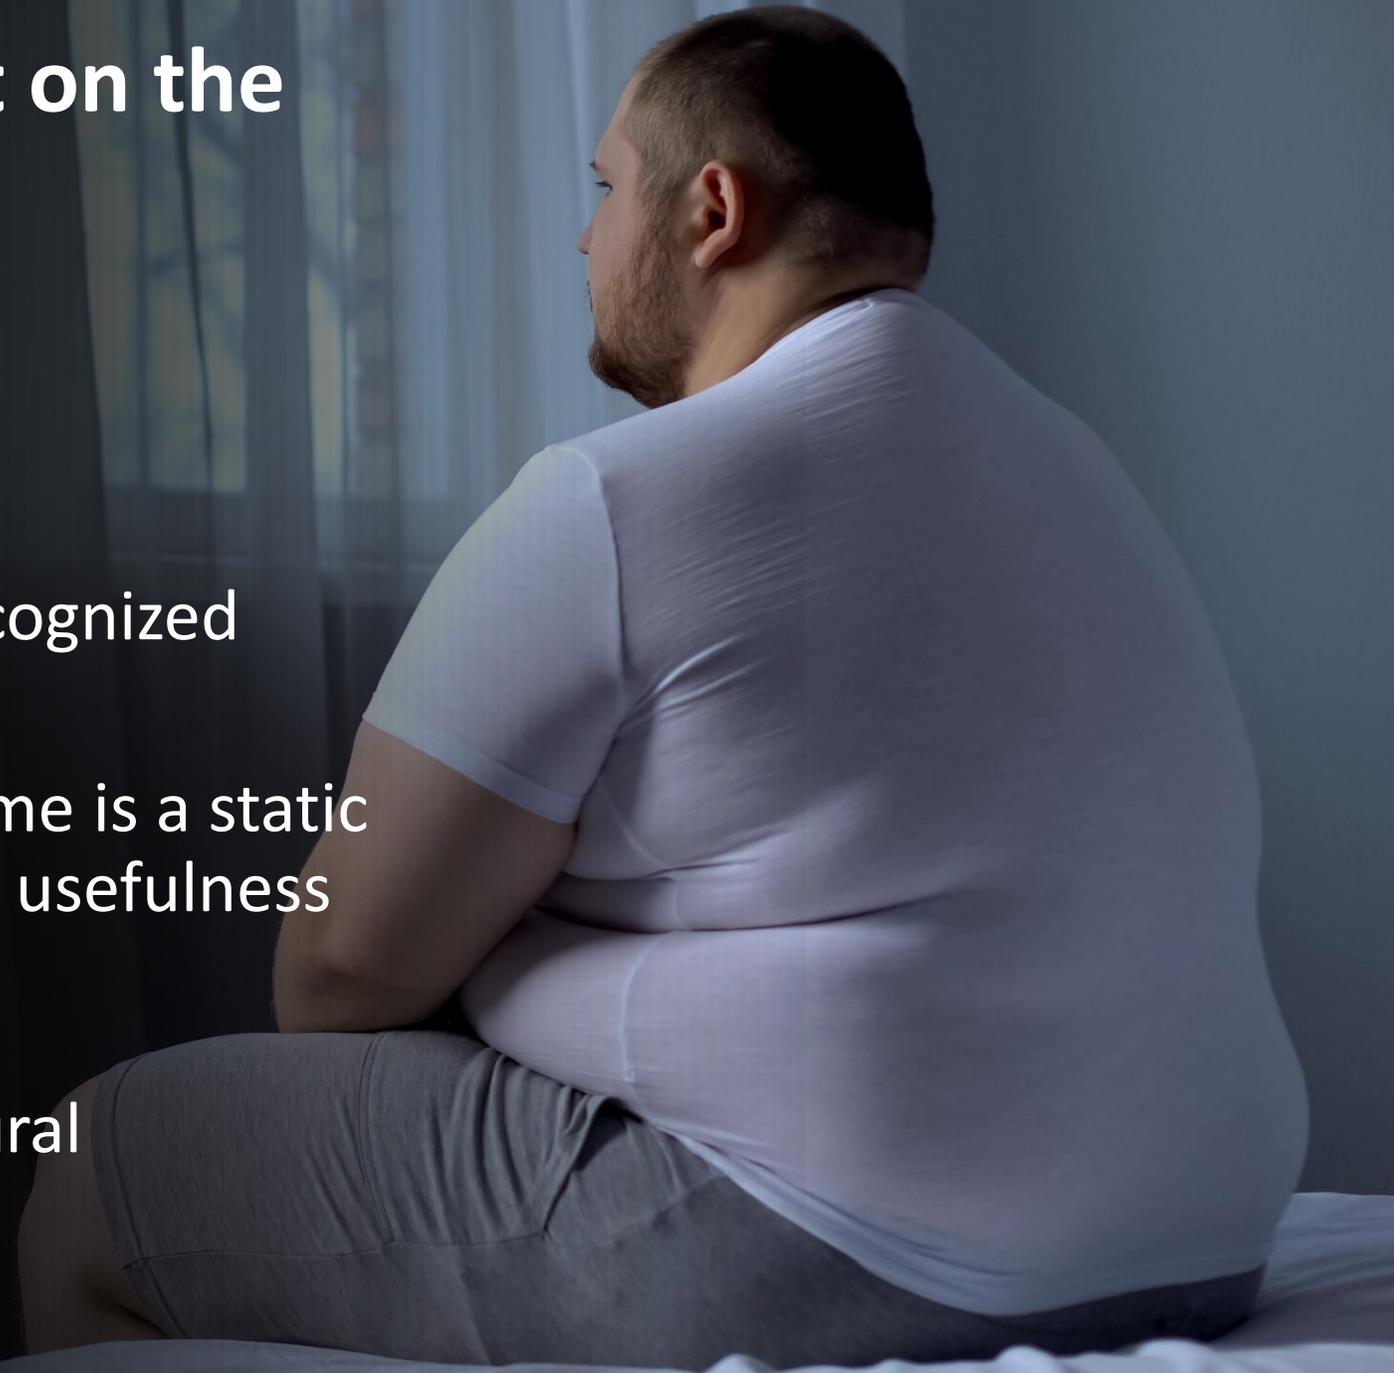

# Need for the Improvement on the Approach

**Diabetes** is gluco-centric

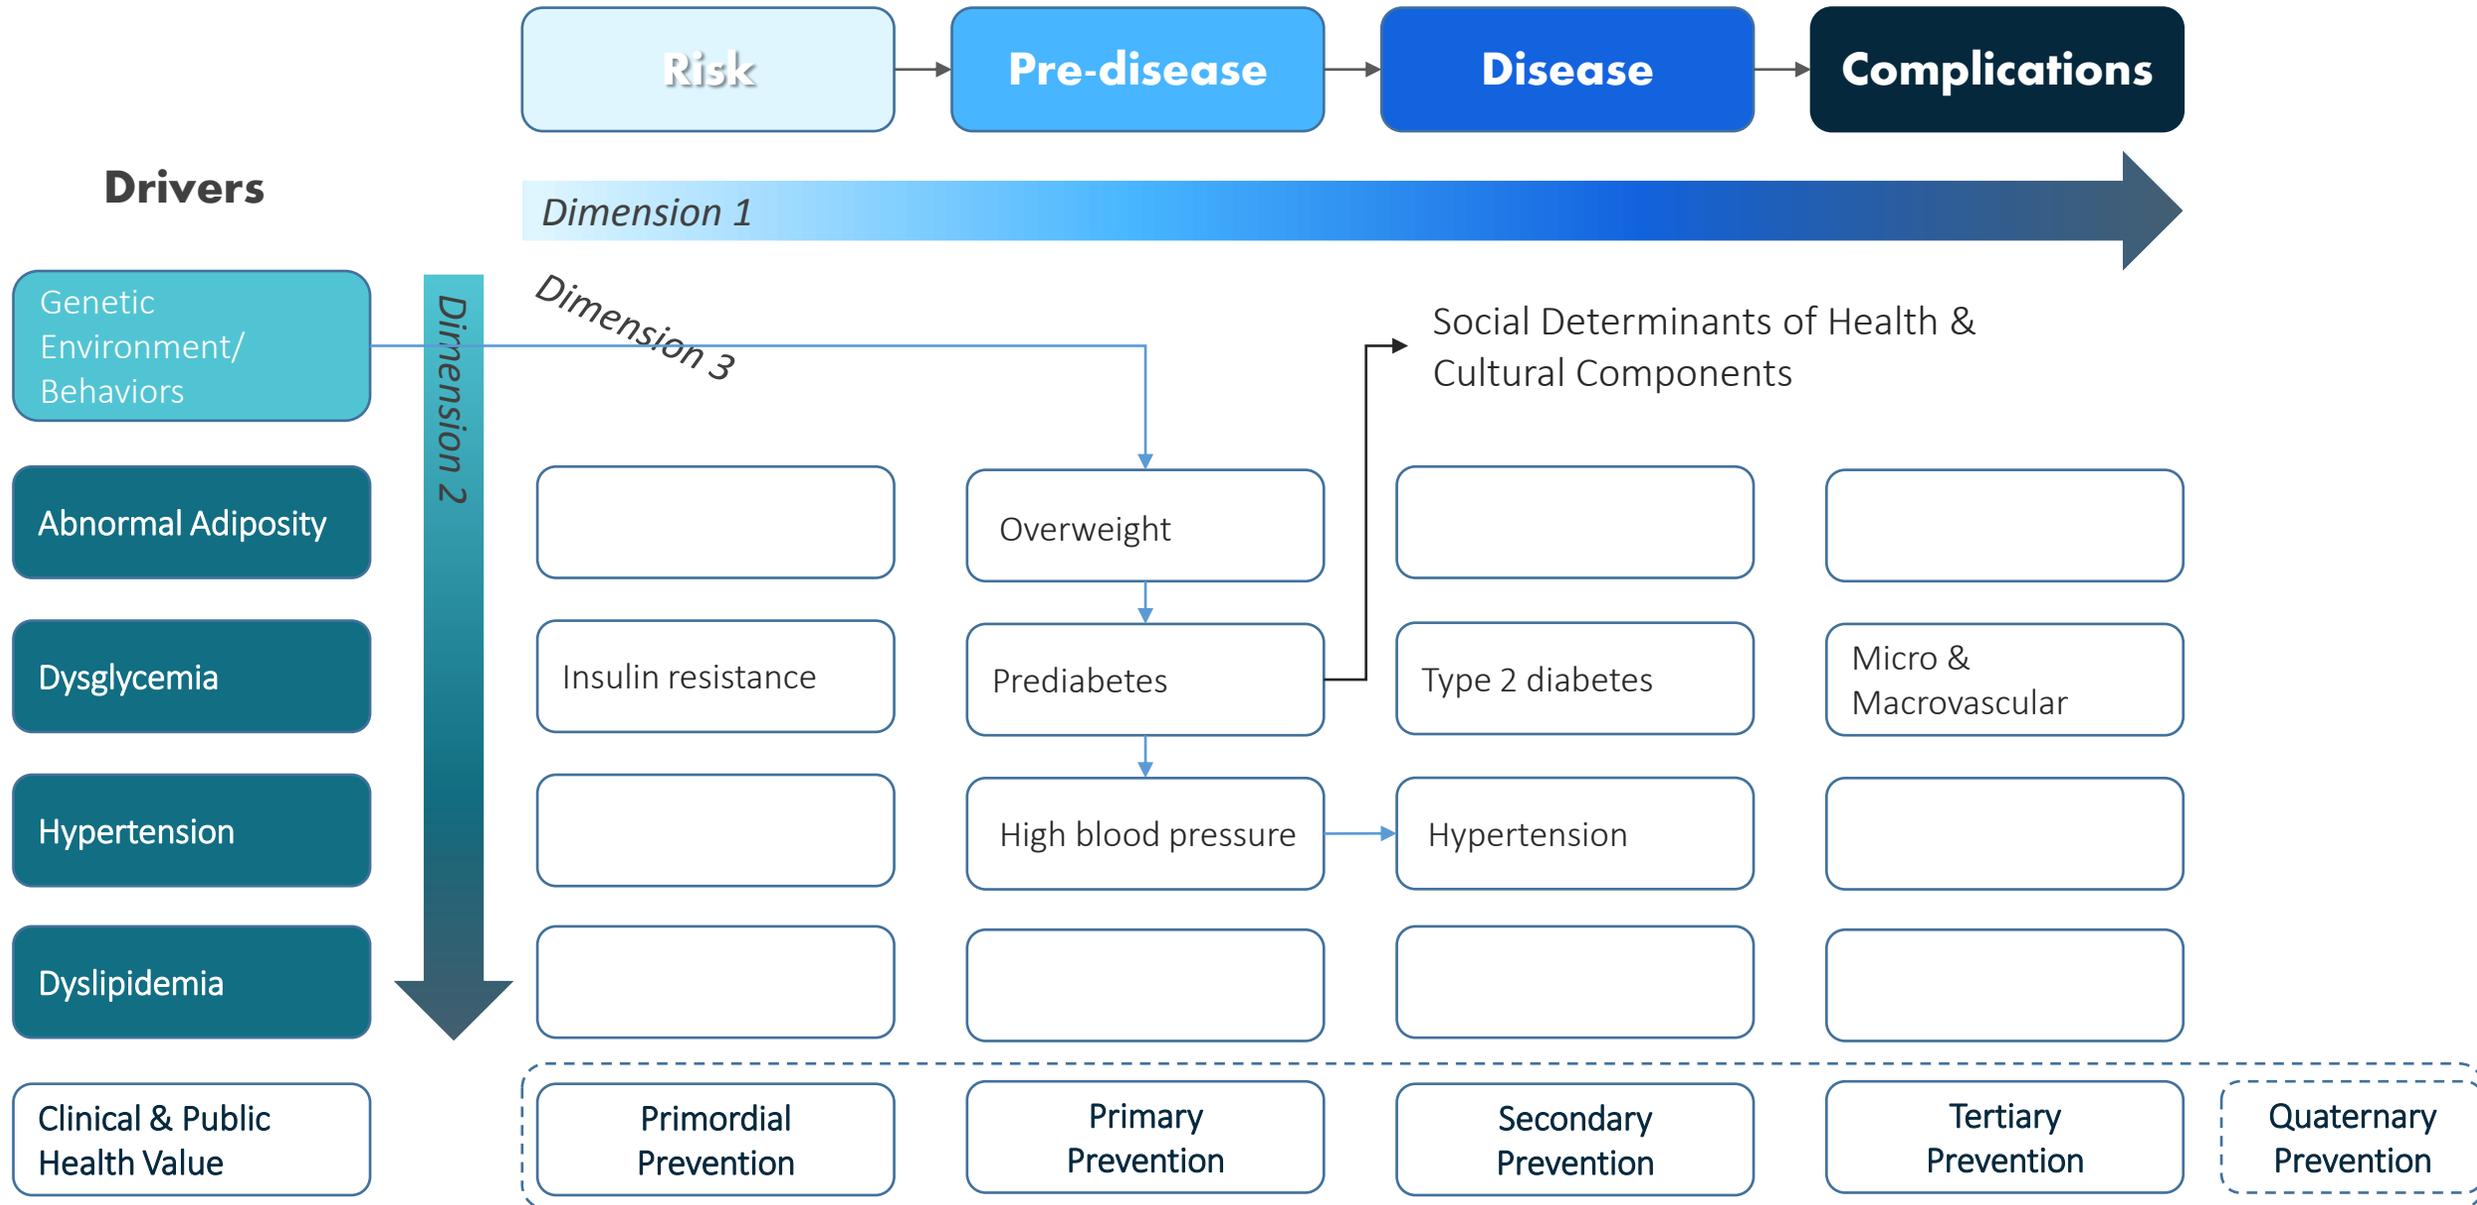

- Prediabetes is not general recognized
- Late management
- Concept of metabolic syndrome is a static approach with limited clinical usefulness

Lack of consideration of cultural and social determinants

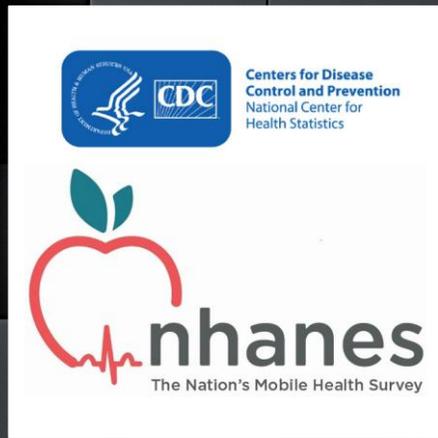

# 3D CMBCD Model - Cardiometabolic-Based Chronic Disease

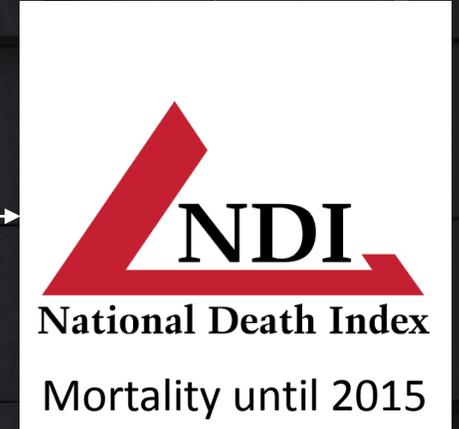

Mechanick, J.I., et al. Cardiometabolic-Based Chronic Disease, Adiposity and Dysglycemia Drivers: JACC State-of-the-Art Review. *JACC* **75**, 525-538 (2020)

# Methods

NHANES  
(1999 – 2012)  
n= 71916

- Exclusions
- Participants under 18 years old or ineligible for obtaining mortality data n = 30698.
  - Records without data on fasting blood glucose levels n = 4756.
  - Records without HDL-c, LDL-c, triglycerides, or total cholesterol data n = 19439.
  - Records without blood pressure measurement data, or medical history n = 2201.
  - Records with missing questionnaire data n = 730.
  - Participants younger than 40, or older than 74 n = 6831

Eligible records  
n= 7261  
men and non-pregnant women  
aged 40-74 years

Median follow-up of 8.1 years  
Deathly cases attributed to  
CVD 160 and all-cause mortality 811

CMBCD

# Conclusions

- **A complication-based approach using the natural story of the cardiometabolic disease allows to stratify and determine the subjects with a higher risk of mortality events**
