

Clinical and echocardiographic parameters associated with outcome in secondary moderate mitral regurgitation.

Camille Sarrazyn

Research fellow in cardiovascular imaging

Current approach of secondary MR.

Recommendations	Class ^b	Level ^c
Valve surgery/intervention is recommended only in patients with severe SMR who remain symptomatic despite GDMT (including CRT if indicated) and has to be decided by a structured collaborative Heart Team. ^{247,323,336,337}	I	B

Vahanian, Alec, et al. "2021 ESC/EACTS Guidelines for the management of valvular heart disease: developed by the Task Force for the management of valvular heart disease of the European Society of Cardiology (ESC) and the European Association for Cardio-Thoracic Surgery (EACTS)." *European heart journal* 43.7 (2022): 561-632.

Otto, Catherine M., et al. "2020 ACC/AHA guideline for the management of patients with valvular heart disease: executive summary: a report of the American College of Cardiology/American Heart Association Joint Committee on Clinical Practice Guidelines." *Journal of the American College of Cardiology* 77.4 (2021): 450-500.

Recommendations for Intervention for Secondary MR		
Referenced studies that support the recommendations are summarized in Online Data Supplement 11.		
COR	LOE	Recommendations
2a	B-R	1. In patients with chronic severe secondary MR related to LV systolic dysfunction (LVEF <50%) who have persistent symptoms (NYHA class II, III, or IV) while on optimal GDMT for HF (Stage D), TEER is reasonable in patients with appropriate anatomy as defined on TEE and with LVEF between 20% and 50%, LVESD ≤70 mm, and pulmonary artery systolic pressure ≤70 mm Hg. ¹⁻⁸
2a	B-NR	2. In patients with severe secondary MR (Stages C and D), mitral valve surgery is reasonable when CABG is undertaken for the treatment of myocardial ischemia. ⁹⁻¹⁵
2b	B-NR	3. In patients with chronic severe secondary MR from atrial annular dilation with preserved LV systolic function (LVEF ≥50%) who have severe persistent symptoms (NYHA class III or IV) despite therapy for HF and therapy for associated AF or other comorbidities (Stage D), mitral valve surgery may be considered. ¹⁶⁻²⁰
2b	B-NR	4. In patients with chronic severe secondary MR related to LV systolic dysfunction (LVEF <50%) who have persistent severe symptoms (NYHA class III or IV) while on optimal GDMT for HF (Stage D), mitral valve surgery may be considered. ^{9,12,21-43}
2b	B-R	5. In patients with CAD and chronic severe secondary MR related to LV systolic dysfunction (LVEF <50%) (Stage D) who are undergoing mitral valve surgery because of severe symptoms (NYHA class III or IV) that persist despite GDMT for HF, chordal-sparing mitral valve replacement may be reasonable to choose over downsized annuloplasty repair. ^{9,12,21-32,44-47}

Why moderate MR?

Prognostic implications of functional mitral regurgitation according to the severity of the underlying chronic heart failure: a long-term outcome study

Severe Atrial Functional Mitral Regurgitation

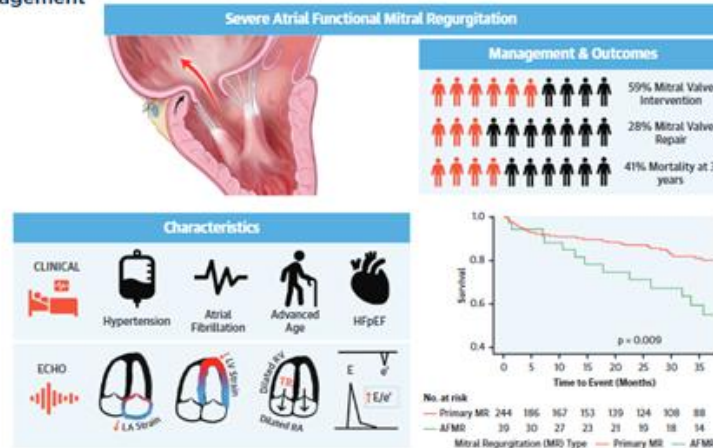

Clinical and Echocardiographic Characteristics, Management and Outcomes

Oltion Mesi, MD,^a Mohamed M. Gad, MD,^a Alejandro D. Crane, MD,^a Jay Ramchand, MBBS,^b Rishi Puri, MD, PhD,^b Habib Layoun, MD,^b Rhonda Miyasaka, MD,^b Marc A. Gillinov, MD,^b Per Wierup, MD, PhD,^c Brian P. Griffin, MD,^b Samir R. Kapadia, MD,^b Serge C. Harb, MD^b

JACC imaging 2021

Severe MR, normal EF

- AFMR
 - N=39
 - Divided in 2 groups
 - Central jet , 30pt
 - Posterior jet , 9pt
 - No significant difference in death
- Primary MR
 - N=244
- => significant difference in survival, HF hospitalisation between both groups
- Worse outcome for aFMR

Mesi, O. et al. J Am Coll Cardiol Img. 2021;14(4):797-808.

Clinical and echocardiographic parameters associated with outcome in secondary moderate mitral regurgitation.

Population	Intervention	Outcome
<p>n= 1061, all moderate MR Euvolemic and haemodynamic stable condition</p> <p>=3 months after ACS or heart failure hospitalization</p> <p>=6 months after CRT implantation</p> 	<p>Retrospective</p> <p>Clinical and echocardiographic risk factors</p>	<p>Primary: All-cause mortality</p> <p>Secondary: composite: all-cause mortality and heart failure *</p> <p>*increase of loop diuretics or heart failure hospitalization</p>

1846 patients moderate FMR

Time range: 2008-2018

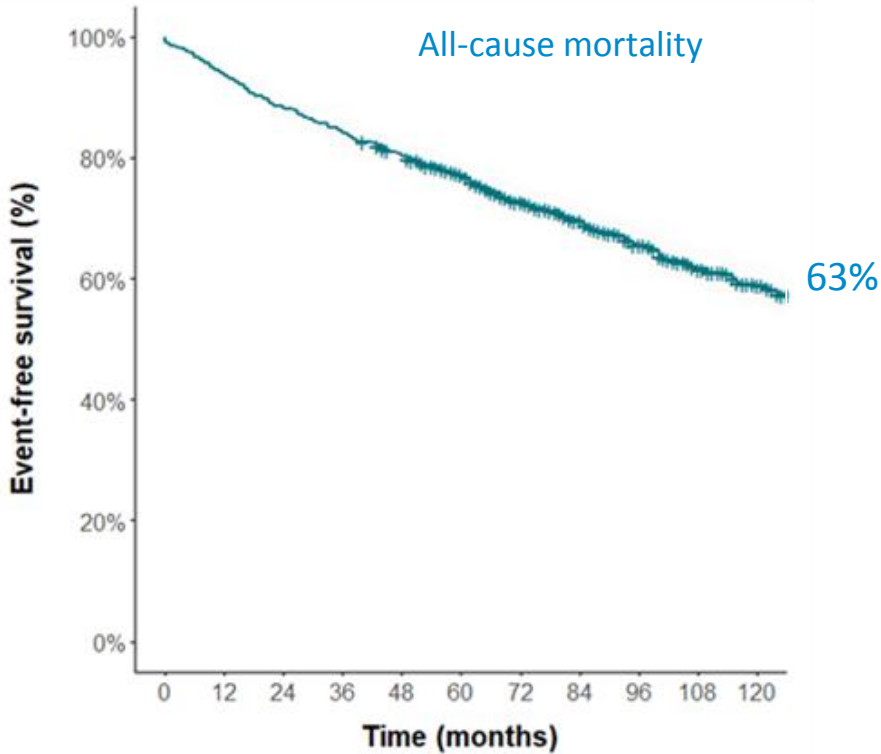

Excluded patients:

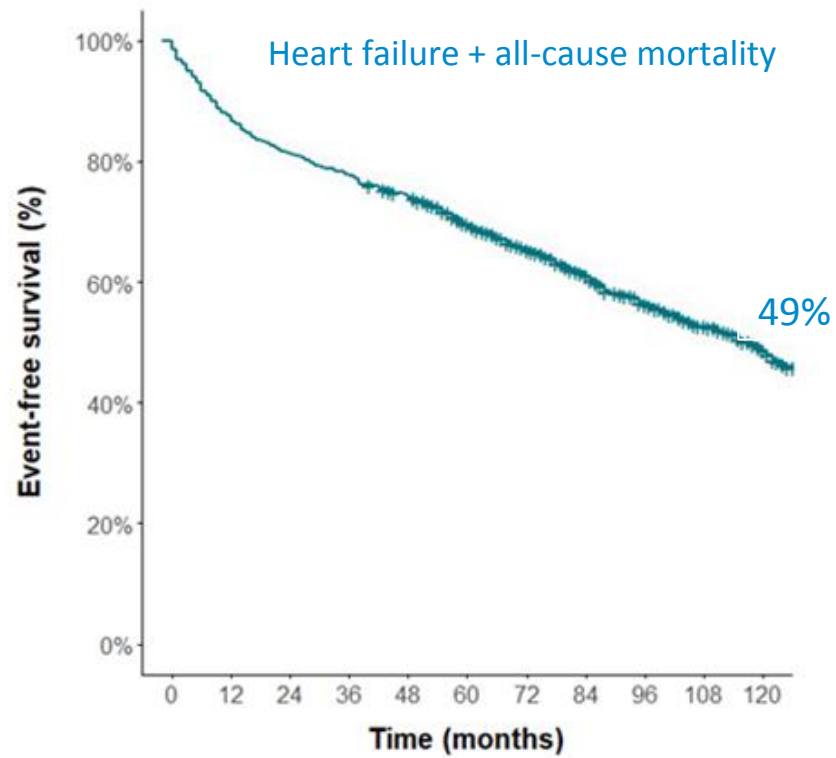

- Congenital cardiomyopathy, n= 36
- Hypertrophic obstructive cardiomyopathy, n= 28
- Mild regurgitation aortic regurgitation or > mild stenosis of left-sided valves, n= 236
- Previous left-sided valve surgery, n= 128
- Echo only during congestion or acute coronary syndrome without follow-up echo, n= 270
- Poor image quality or no patient files, n= 87

1061 patients moderate FMR

vFMR	118	100	96	93	87	79	67	50	39	34	30
	0	12	24	36	48	60	72	84	96	108	120

Matched groups

Groups are matched for:
age, sex, diabetes, COPD, eGFR, NYHA class, LV EF, LAVI, TR, RV-PA coupling index

Focus on NYHA

All-cause mortality

Heart failure + all-cause mortality

Total population

NYHA I-II
 NYHA III-IV

Matched groups

Groups are matched for:
 age, sex, diabetes, COPD, eGFR, FMR etiology+LV
 EF, LVEF, LAVI, TR, RV-PA coupling index

Conclusion:

In moderate MR, symptoms and FMR etiology have a significant association with outcome.

Early recognition of etiology implies a better risk stratification and may be helpful in management.
